## **DETAILED ACTION**

### ***Claim Objections***

1. Claims 3, 7 and 13 are objected to because of the following informalities: there claim dependency is inaccurate. Appropriate correction is required.

### ***Claim Rejections - 35 USC § 112***

2. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.
3. Claim 10 is rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the enablement requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention. The Examiner believes the superconductor should be included in the second power transmission line, because later in the claim it states that the second impedance characteristic is less than the first and superconductors have virtually no impedance. Also, in all embodiments in the specification, the second line had the superconductor. Appropriate correction is requested.

### ***Claim Rejections - 35 USC § 103***

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person

having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. Claims 1, 3, 5, and 7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sinha et al. (2003/0183410) and Morita (6,344,956). Sinha teaches first and second transmission lines in parallel, and the second line including a superconductor ([0134]; Fig. 29). It is also inherent that the second impedance characteristic is less than the first, based on the superconductor (also see [0144]). He also teaches the superconductor being a cold-dielectric high temperature superconductor (Fig. 5). He also teaches a refrigeration system for cooling the high temperature superconductor ([0137]). Sinha fails to teach the use of a power flow controller, which is a reactor. Morita teaches a power flow controller, which controls the magnitude of the power flowing through a superconductor, where the controller could be a reactor (Col. 1, lines 35-43). It would have been obvious to one of ordinary skill in the art at the time of the invention to add a reactor onto the superconductor transmission line of Sinha's invention to regulate the power flow through the line and also reacts quickly to short-circuit accidents.

6. Claim 4 is rejected under 35 U.S.C. 103(a) as being unpatentable over Sinha et al. (2003/0183410) and Morita (6,344,956) as applied to claims 1 and 3 above, and further in view of Talisa et al. (5,878,334). Sinha teaches a superconductor being an oxide (Abstract), but fails to specify exactly what type of oxide superconductor. Talisa teaches the use of a high temperature superconductor made of Tl-Ba-Ca-Cu-O. It would have been obvious to one of ordinary skill in the art at the time of the invention to use Talisa's superconductor in Sinha's

invention since it is known in the art and the exact type of superconductor that Sinha describes isn't explicitly known.

7. Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over Sinha et al. (2003/0183410) and Morita (6,344,956) as applied to claim 1 above, and further in view of Shimomura et al. (JP 11122793A). Sinha and Morita teach a multi-line power transmission system. Neither reference explicitly teaches what the first transmission line is made of. Shimomura teaches a power transmission line which is a cross-linked polyethylene power transmission line (USE). It would have been obvious to one of ordinary skill in the art at the time of the invention to implement this transmission line into Sinha's invention since it is known in the art as a working power transmission line that carries high voltages and Sinha doesn't teach a specific type in his invention.

8. Claims 8-9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sinha et al. (2003/0183410) and Morita (6,344,956) as applied to claim 1 above, and further in view of Hingorani (5,420,495). Sinha and Morita teach a multi-line power transmission system. Neither reference explicitly teaches a bi-directional power flow controller which is also a phase angle regulator. Hingorani teaches a bi-directional power flow controller which also regulates the phase angle (Col. 2, lines 45-47, 58-60). It would have been obvious to one of ordinary skill in the art at the time of the invention to implement this controller into Sinha's invention so that the operator can have more control over the flow of power in the system.

9. Claims 10, 11, and 13-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sinha et al. (2003/0183410) and Hingorani (5,420,495). Sinha teaches first and second transmission lines in parallel, and the second line including a superconductor ([0134]; Fig. 29). It is also inherent that the second impedance characteristic is less than the first, based on the superconductor (also see [0144]). He also teaches the superconductor being a cold-dielectric high temperature superconductor (Fig. 5). He also teaches a refrigeration system for cooling the high temperature superconductor to keep it in a specified operating range ([0137]). Sinha fails to teach determining and regulating the level and amount of power flow through the second transmission line. Hingorani teaches a bi-directional power flow controller which determines and regulates the power flowing in the transmission line (Col. 2, lines 45-47, 51-55). It would have been obvious to one of ordinary skill in the art at the time of the invention to implement this controller into Sinha's invention so that the operator can have more control over the flow of power in the system.

10. Claim 15 is rejected under 35 U.S.C. 103(a) as being unpatentable over Sinha et al. (2003/0183410) and Hingorani (5,420,495) as applied to claim 10 above, and further in view of Shimomura et al. (JP 11122793A). Sinha and Hingorani teach a multi-line power transmission system. Neither reference explicitly teaches what the first transmission line is made of. Shimomura teaches a power transmission line which is a cross-linked polyethylene power transmission line (USE). It would have been obvious to one of ordinary skill in the art at the time of the invention to implement this transmission line into Sinha's invention since it is known

in the art as a working power transmission line that carries high voltages and Sinha doesn't teach a specific type in his invention.

***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Dru M. Parries whose telephone number is (571) 272-8542. The examiner can normally be reached on Monday -Thursday from 8:00am to 5:00pm. The examiner can also be reached on alternate Fridays.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Brian Sircus, can be reached on 571-272-2800 x 36. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300. Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
